

CPPDescent

30486a9 (with uncommitted changes)

Generated by Doxygen 1.9.6

Chapter 1

CPP-Descent

Part of the “Software Development for Computing Systems” course of the Department of Informatics and Telecommunications, UoA for the first semester of the academic year 2023-2024.

A library that implements the KNN-Graph creation and search algorithms described in [1], [2].

1.1 Dependencies

For local development, you will need Make and CMake. To install them on an apt-based linux distro, run the following commands:

```
$ sudo apt update && sudo apt upgrade
$ sudo apt install make
$ sudo apt install cmake
```

1.1.1 Minor dependencies

- The project uses Google Test for its testing needs. Gtest is used as a git submodule of this repo, that is downloaded by CMake the first time you clone. That means that nothing extra needs to be installed to run the tests.
- If you would like to generate the documentation, you will need doxygen installed.

1.2 Code Structure

In the [wiki](#), you can find documentation generated by Doxygen. It is also available in [pdf form](#).

1.2.1 Code Coverage

This project uses LCOV for its code coverage needs. The results are uploaded upon commit [here](#).

1.3 Contributors

- [Konstantinos Chousos](#) (1115202000215)
- [Anastasios-Fedon Seitanidis](#) (1115202000179)

1.4 Bibliography

Chapter 2

Class Index

2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

cppdescent	A sample function for the cppdescent class, used to test the correctness of the CMake files . . .	??
List	ADT List	??
ListNode	Node of a list	??
Map		??
MapNode		??
PQueue	ADT Priority Queue	??
Vector	ADT Vector	??
vectorNode	Class for the vector Node object	??

Chapter 3

File Index

3.1 File List

Here is a list of all documented files with brief descriptions:

ADTList.hpp	..	??
ADTMap.hpp	..	??
ADTPQueue.hpp	..	??
ADTVector.hpp	..	??
ADTVector implementation using a dynamic array	..	??
common.hpp	..	??
cppdescent.hpp	..	??
ADTList.cpp	..	??
Implementation of an ADT linked list	..	??
ADTMap.cpp	..	??
Implementation of ADTMap	..	??
ADTPQueue.cpp	..	??
An ADT Priority Queue implemented using a heap	..	??
ADTVector.cpp	..	??
Implementation of ADTVector using a dynamic array	..	??
cppdescent.cpp	..	??
Implementation of cppdescent library	..	??
listNode.cpp	..	??
Implementation of the listNode to be used with linkedList	..	??

Chapter 4

Class Documentation

4.1 cppdescent Class Reference

A sample function for the cppdescent class, used to test the correctness of the CMake files.

```
#include <cppdescent.hpp>
```

Public Member Functions

- `int hello (void)`
Prints "Hello World".

4.1.1 Detailed Description

A sample function for the cppdescent class, used to test the correctness of the CMake files.

4.1.2 Member Function Documentation

4.1.2.1 `hello()`

```
int cppdescent::hello (  
    void )
```

Prints "Hello World".

Returns

int exit code

The documentation for this class was generated from the following files:

- `cppdescent.hpp`
- `cppdescent.cpp`

4.2 List Class Reference

ADT [List](#).

```
#include <ADTList.hpp>
```

Public Member Functions

- [List](#) (DestroyFunc value=nullptr)
Construct a new [List](#) object.
- [~List](#) ()
Destroy the [List](#) object.
- void [insertNext](#) ([ListNode](#) *node, Pointer value)
Adds a node after the given node.
- void [removeNext](#) ([ListNode](#) *node)
Removes the node after the given node.
- Pointer [find](#) (Pointer value, CompareFunc compare)
Finds the first value equal to the value parameter.
- DestroyFunc [setDestroyValue](#) (DestroyFunc value)
Set the Destroy Value object to a new value.
- int [getSize](#) ()
Get the size of the [List](#).
- int [increaseSize](#) ()
Increase the list size.
- int [decreaseSize](#) ()
Decrease the list size.
- [ListNode](#) * [getHead](#) ()
Getter for the head of the [List](#).
- [ListNode](#) * [getTail](#) ()
Getter for the tail of the [List](#).
- [ListNode](#) * [next](#) ([ListNode](#) *node)
Returns the node after the given one.
- Pointer [nodeValue](#) ([ListNode](#) *node)
Returns the value of the node.
- [ListNode](#) * [findNode](#) (Pointer value, CompareFunc compare)
Finds the first node that has value equal to the value parameter.

4.2.1 Detailed Description

ADT [List](#).

An Abstract Data Type [List](#) with linear access to data, and addition and removal to/from arbitrary positions.

4.2.2 Constructor & Destructor Documentation

4.2.2.1 List()

```
List::List (
    DestroyFunc value = nullptr )
```

Construct a new [List](#) object.

Parameters

<i>destroyValue</i>	If <i>destroyValue</i> != nullptr, the <i>destroyValue</i> function will be called each time a node is removed.
---------------------	---

head is a virtual node that is always present in the list.

Parameters

<i>destroyValue</i>	The destroy function for the values of the list. Defaults to nullptr.
---------------------	---

4.2.2.2 ~List()

```
List::~~List ( )
```

Destroy the [List](#) object.

If the *destroyValue* function is not nullptr, it is called for every value.

4.2.3 Member Function Documentation**4.2.3.1 decreaseSize()**

```
int List::decreaseSize ( )
```

Decrease the list size.

Returns

int The updated size.

4.2.3.2 find()

```
Pointer List::find (
    Pointer value,
    CompareFunc compare )
```

Finds the first value equal to the value parameter.

Find the first value equal to the value parameter.

Parameters

<i>value</i>	The value based on which the search is done.
<i>compare</i>	A pointer to the function that will compare the node values.

Returns

Pointer A pointer to the resulting node.

Parameters

<i>value</i>	The value to search for.
<i>compare</i>	A pointer to the compare function.

Returns

Pointer A pointer to found value.

4.2.3.3 findNode()

```
ListNode * List::findNode (
    Pointer value,
    CompareFunc compare )
```

Finds the first node that has value equal to the value parameter.

Find the first node with value equal to the value parameter.

Parameters

<i>value</i>	The value to search.
<i>compare</i>	The compare function to use.

Returns

ListNode* A pointer to the resulting node.

Parameters

<i>value</i>	The value to search for.
<i>compare</i>	A pointer to the compare function.

Returns

ListNode* A pointer to the found node.

4.2.3.4 getHead()

```
ListNode * List::getHead ( )
```

Getter for the head of the [List](#).

Get the first element of the [List](#).

Returns

ListNode* The head.

Returns

ListNode* Pointer to the first element.

4.2.3.5 getSize()

```
int List::getSize ( )
```

Get the size of the [List](#).

Get the size of the list.

The size is updated upon entry/removal of nodes, so the retrieval of the size is O(1).

Returns

int

Returns

int The size.

4.2.3.6 getTail()

```
ListNode * List::getTail ( )
```

Getter for the tail of the [List](#).

Get the last element of the list.

Returns

ListNode* The tail.

If the list is empty, the virtual head is the tail, so we return nullptr.

Returns

ListNode* Pointer to the last element.

4.2.3.7 increaseSize()

```
int List::increaseSize ( )
```

Increase the list size.

Returns

int The updated size.

4.2.3.8 insertNext()

```
void List::insertNext (
    ListNode * node,
    Pointer value )
```

Adds a node *after* the given node.

Insert a new element after the node.

Parameters

<i>node</i>	The node that the new node will be placed after.
<i>value</i>	The value of the new node.

Parameters

<i>node</i>	The node after which the element is inserted.
<i>value</i>	The value of the new element.

4.2.3.9 next()

```
ListNode * List::next (
    ListNode * node )
```

Returns the node after the given one.

Get the next node.

Parameters

<i>node</i>	
-------------	--

Returns

ListNode* A pointer to the next node.

Parameters

<i>node</i>	
-------------	--

Returns

ListNode*

4.2.3.10 nodeValue()

```
Pointer List::nodeValue (  
    ListNode * node )
```

Returns the value of the node.

Get the node's value.

Parameters

<i>node</i>	
-------------	--

Returns

Pointer A generic pointer to the value.

Parameters

<i>node</i>	
-------------	--

Returns

Pointer

4.2.3.11 removeNext()

```
void List::removeNext (  
    ListNode * node )
```

Removes the node *after* the given node.

Removes the node after the given node.

Parameters

<i>node</i>	The node before the node to be removed.
-------------	---

Parameters

<i>node</i>	The node after which the element is removed.
-------------	--

4.2.3.12 setDestroyValue()

```
DestroyFunc List::setDestroyValue (
    DestroyFunc value )
```

Set the Destroy Value object to a new value.

Set the destroy value function.

Parameters

<i>value</i>	A pointer to the new destroy funciton.
--------------	--

Returns

DestroyFunc A pointer to the old destroy function.

Parameters

<i>value</i>	The new destroy function.
--------------	---------------------------

Returns

DestroyFunc The old destroy function.

The documentation for this class was generated from the following files:

- ADTList.hpp
- [ADTList.cpp](#)

4.3 ListNode Class Reference

Node of a list.

```
#include <ADTList.hpp>
```

Public Member Functions

- [ListNode](#) ()
Construct a new [List](#) Node object that is empty.
- [ListNode](#) (Pointer value)
Construct a new [List](#) Node object with value 'value'.
- void [setNext](#) ([ListNode](#) *next)
Setter for the next node.
- [ListNode](#) * [getNext](#) ()
Getter for the next node.
- Pointer [getValue](#) ()
Getter for the value of the node.

4.3.1 Detailed Description

Node of a list.

A list node is represented by its value. It also holds a pointer to the next node in the list.

4.3.2 Constructor & Destructor Documentation

4.3.2.1 [ListNode\(\)](#) [1/2]

```
ListNode::ListNode ( ) [inline]
```

Construct a new [List](#) Node object that is empty.

4.3.2.2 [ListNode\(\)](#) [2/2]

```
ListNode::ListNode (
    Pointer value ) [inline]
```

Construct a new [List](#) Node object with value 'value'.

Parameters

<i>value</i>	a generic pointer to the value of the node.
--------------	---

4.3.3 Member Function Documentation

4.3.3.1 getNext()

```
ListNode * ListNode::getNext ( )
```

Getter for the next node.

Returns

ListNode* The pointer to the next node.

4.3.3.2 getValue()

```
Pointer ListNode::getValue ( )
```

Getter for the value of the node.

Returns

Pointer A generic pointer to the value.

4.3.3.3 setNext()

```
void ListNode::setNext (
    ListNode * next )
```

Setter for the next node.

Parameters

<i>next</i>	The pointer to the next node.
-------------	-------------------------------

The documentation for this class was generated from the following files:

- ADTList.hpp
- [listNode.cpp](#)

4.4 Map Class Reference

Public Member Functions

- [Map](#) (CompareFunc compare, DestroyFunc destroyKey, DestroyFunc destroyValue)
Construct a new [Map::Map](#) object.
- [~Map](#) ()

- Destroy the `Map::Map` object.
- void `insert` (Pointer key, Pointer value)
Add a new pair (key --> value) in the map.
- bool `remove` (Pointer key)
Remove from the map the pair (key --> value) that corresponds to the given key.
- Pointer `find` (Pointer key)
- void `rehash` ()
Extend the hash table in case the load factor exceeds the predefined threshold.
- void `setCapacity` (int capacity)
- void `setDestroyKey` (DestroyFunc destroyKey)
- void `setDestroyValue` (DestroyFunc destroyValue)
- void `setHashFunction` (HashFunc hash)
- `MapNode` ** `getArray` ()
- int `getCapacity` ()
- int `getSize` ()
- int `getDeleted` ()
- DestroyFunc `getDestroyKey` ()
- DestroyFunc `getDestroyValue` ()
- HashFunc `getHashFunction` ()
- `MapNode` * `getFirst` ()
- `MapNode` * `getNext` (`MapNode` *node)
- `MapNode` * `findNode` (Pointer key)

4.4.1 Constructor & Destructor Documentation

4.4.1.1 Map()

```
Map::Map (
    CompareFunc compare,
    DestroyFunc destroyKey,
    DestroyFunc destroyValue )
```

Construct a new `Map::Map` object.

Parameters

<code>compare</code>	A compare function to keep the map sorted
<code>destroyKey</code>	A destroy function for the key of every node
<code>destroyValue</code>	A destroy function fro the balue of every node

4.4.1.2 ~Map()

```
Map::~Map ( )
```

Destroy the `Map::Map` object.

4.4.2 Member Function Documentation

4.4.2.1 findNode()

```
MapNode * Map::findNode (
    Pointer key )
```

Parameters

<i>key</i>	
------------	--

Returns

MapNode*

4.4.2.2 getFirst()

```
MapNode * Map::getFirst ( )
```

Returns

MapNode*

4.4.2.3 getNext()

```
MapNode * Map::getNext (
    MapNode * node )
```

Parameters

<i>node</i>	
-------------	--

Returns

MapNode*

4.4.2.4 insert()

```
void Map::insert (
    Pointer key,
    Pointer value )
```

Add a new pair (key --> value) in the map.

Parameters

<i>key</i>	
<i>value</i>	

4.4.2.5 rehash()

```
void Map::rehash ( )
```

Extend the hash table in case the load factor exceeds the predefined threshold.

Parameters

<i>map</i>	The map whose hash table needs to be rehashed
------------	---

4.4.2.6 remove()

```
bool Map::remove (
    Pointer key )
```

Remove from the map the pair (key --> value) that corresponds to the given key.

Returns

true he node with the given key was removed successfully
false he node with the given key was not removed

The documentation for this class was generated from the following files:

- [ADTMap.hpp](#)
- [ADTMap.cpp](#)

4.5 MapNode Class Reference

Public Member Functions

- **MapNode** (Pointer key, Pointer value, State state)
- void **setKey** (Pointer key)
- void **setValue** (Pointer value)
- void **setState** (State state)
- Pointer **getKey** ()
- Pointer **getValue** ()
- State **getState** ()

The documentation for this class was generated from the following file:

- [ADTMap.hpp](#)

4.6 PQueue Class Reference

ADT Priority Queue.

```
#include <ADTPQueue.hpp>
```

Public Member Functions

- **PQueue** (CompareFunc compare, DestroyFunc destroyValue, **Vector** *values)
Construct a new PQueue object.
- **~PQueue** ()
Destroy the PQueue object.
- int **getSize** ()
Get the size of the priority queue.
- Pointer **getMax** ()
Get the max element of the queue.
- void **insert** (Pointer value)
Insert a new element to the queue.
- void **removeMax** ()
Remove the max of the queue.
- DestroyFunc **setDestroyValue** (DestroyFunc destroyValue)
Set the Destroy Value object.
- Pointer **nodeValue** (int nodeId)
- void **nodeSwap** (int nodeId1, int nodeId2)
- void **bubbleUp** (int nodeId)
- void **bubbleDown** (int nodeId)
- void **naiveHeapify** (**Vector** *values)

4.6.1 Detailed Description

ADT Priority Queue.

4.6.2 Constructor & Destructor Documentation

4.6.2.1 PQueue()

```
PQueue::PQueue (
    CompareFunc compare,
    DestroyFunc destroyValue,
    Vector * values )
```

Construct a new [PQueue](#) object.

Uses the `compare` function to compare its elements.

If `destroyValue != nullptr`, the `destroyValue` function is called upon removal of an element.

If `values != nullptr`, then the priority queue will be initialized with the values of the vector `values`.

Parameters

<i>compare</i>	
<i>destroyValue</i>	
<i>values</i>	

4.6.2.2 ~PQueue()

```
PQueue::~~PQueue ( )
```

Destroy the [PQueue](#) object.

4.6.3 Member Function Documentation

4.6.3.1 getMax()

```
Pointer PQueue::getMax ( )
```

Get the max element of the queue.

Returns

Pointer A generic pointer to the max element.

4.6.3.2 getSize()

```
int PQueue::getSize ( )
```

Get the size of the priority queue.

Returns

int

4.6.3.3 insert()

```
void PQueue::insert (
    Pointer value )
```

Insert a new element to the queue.

Parameters

<i>value</i>	The value of the new element to be inserted.
--------------	--

4.6.3.4 removeMax()

```
void PQueue::removeMax ( )
```

Remove the max of the queue.

4.6.3.5 setDestroyValue()

```
DestroyFunc PQueue::setDestroyValue (
    DestroyFunc destroyValue )
```

Set the Destroy Value object.

Parameters

<i>destroyValue</i>	
---------------------	--

Returns

DestroyFunc

The documentation for this class was generated from the following files:

- [ADTPQueue.hpp](#)
- [ADTPQueue.cpp](#)

4.7 Vector Class Reference

ADT [Vector](#).

```
#include <ADTVector.hpp>
```

Public Member Functions

- [Vector](#) (int size, DestroyFunc destroyValue)
Construct a new [Vector](#) object.
- [~Vector](#) ()
Destroy the [Vector](#) object.
- int [getSize](#) ()
Get the current size of the [Vector](#).
- void [insertLast](#) (Pointer value)
Inserts a new element at the end of the vector.
- int [removeLast](#) ()
Removes the last element of the vector.
- Pointer [getAt](#) (int pos)
Get the value at the specified position of the vector.
- int [setAt](#) (int pos, Pointer value)
Set the value at the specified position of the vector.
- Pointer [find](#) (Pointer value, CompareFunc compare)
Find the first element with value equal to value.
- DestroyFunc [setDestroyValue](#) (DestroyFunc destroyValue)
Set the Destroy Value.
- [vectorNode](#) * [first](#) ()
Get the first node of the vector.
- [vectorNode](#) * [last](#) ()
Get the last node of the vector.
- [vectorNode](#) * [next](#) ([vectorNode](#) *node)
Get the next node of the vector, after the one given.
- [vectorNode](#) * [previous](#) ([vectorNode](#) *node)
Get the previous node of the vector, before the one given.
- Pointer [nodeValue](#) ([vectorNode](#) *node)
Get the value of the node.
- [vectorNode](#) * [findNode](#) (Pointer value, CompareFunc compare)
Find the first node with value equal to value.

4.7.1 Detailed Description

ADT [Vector](#).

An ADT [Vector](#) using a dynamic array for smart resizing.

4.7.2 Constructor & Destructor Documentation

4.7.2.1 Vector()

```
Vector::Vector (
    int size,
    DestroyFunc destroyValue )
```

Construct a new [Vector](#) object.

The newly created [Vector](#) will be of size `size` and its elements will be initialized as `nullptr`.

If `destroyValue` is not `nullptr`, it will be called on each element when it is removed from the [Vector](#).

Parameters

<i>size</i>	The initial size of the Vector .
<i>destroyValue</i>	The function to be called on each element when it is removed from the Vector .

4.7.2.2 ~Vector()

```
Vector::~~Vector ( )
```

Destroy the [Vector](#) object.

Deletes all allocated memory of the [Vector](#).

4.7.3 Member Function Documentation

4.7.3.1 find()

```
Pointer Vector::find (
    Pointer value,
    CompareFunc compare )
```

Find the first element with value equal to `value`.

Parameters

<i>value</i>	The value to look for.
<i>compare</i>	The function to be used for comparison.

Returns

Pointer A pointer to the found value.

4.7.3.2 findNode()

```
vectorNode * Vector::findNode (
    Pointer value,
    CompareFunc compare )
```

Find the first node with value equal to value.

Parameters

<i>value</i>	The value to look for.
<i>compare</i>	The function to be used for comparison.

Returns

[vectorNode](#) The resulting node.

4.7.3.3 first()

```
vectorNode * Vector::first ( )
```

Get the first node of the vector.

Returns

[vectorNode](#)

4.7.3.4 getAt()

```
Pointer Vector::getAt (
    int pos )
```

Get the value at the specified position of the vector.

Parameters

<i>pos</i>	The position to look for.
------------	---------------------------

Returns

Pointer A pointer to the value at the specified position.

4.7.3.5 getSize()

```
int Vector::getSize ( )
```

Get the current size of the [Vector](#).

Returns

int The size of the [Vector](#).

4.7.3.6 insertLast()

```
void Vector::insertLast (
    Pointer value )
```

Inserts a new element at the end of the vector.

Parameters

<i>value</i>	The value of the new element.
--------------	-------------------------------

If we are at the last element, we create a new array double the size.

4.7.3.7 last()

```
vectorNode * Vector::last ( )
```

Get the last node of the vector.

Returns

[vectorNode](#)

4.7.3.8 next()

```
vectorNode * Vector::next (
    vectorNode * node )
```

Get the next node of the vector, after the one given.

Parameters

<i>node</i>	The node to get the next of.
-------------	------------------------------

Returns

[vectorNode](#)

4.7.3.9 nodeValue()

```
Pointer Vector::nodeValue (
    vectorNode * node )
```

Get the value of the node.

Parameters

<i>node</i>	
-------------	--

Returns

Pointer

4.7.3.10 previous()

```
vectorNode * Vector::previous (
    vectorNode * node )
```

Get the previous node of the vector, before the one given.

Parameters

<i>node</i>	The node to get the previous of.
-------------	----------------------------------

Returns

[vectorNode](#)

4.7.3.11 removeLast()

```
int Vector::removeLast ( )
```

Removes the last element of the vector.

Returns

int -1 if the function fails, else 0.

4.7.3.12 setAt()

```
int Vector::setAt (
    int pos,
    Pointer value )
```

Set the value at the specified position of the vector.

Parameters

<i>pos</i>	The position to edit.
<i>value</i>	The new value.

Returns

int -1 if the function fails, else 0.

4.7.3.13 setDestroyValue()

```
DestroyFunc Vector::setDestroyValue (
    DestroyFunc destroyValue )
```

Set the Destroy Value.

Parameters

<i>destroyValue</i>	The new destroy value function.
---------------------	---------------------------------

Returns

DestroyFunc The old destroy value function.

The documentation for this class was generated from the following files:

- [ADTVector.hpp](#)
- [ADTVector.cpp](#)

4.8 vectorNode Class Reference

Class for the vector Node object.

```
#include <ADTVector.hpp>
```

Public Member Functions

- [vectorNode](#) ()
Construct a new vector Node object.
- **vectorNode** (Pointer value)
- Pointer [getValue](#) () const
Get the Value object.
- void [setValue](#) (Pointer value)
Set the Value object.

4.8.1 Detailed Description

Class for the vector Node object.

A vector node is described only its value.

4.8.2 Constructor & Destructor Documentation

4.8.2.1 vectorNode()

```
vectorNode::vectorNode ( ) [inline]
```

Construct a new vector Node object.

Parameters

<i>value</i>	A Pointer to the value.
--------------	-------------------------

4.8.3 Member Function Documentation

4.8.3.1 getValue()

```
Pointer vectorNode::getValue ( ) const [inline]
```

Get the Value object.

Returns

Pointer

4.8.3.2 setValue()

```
void vectorNode::setValue (
    Pointer value ) [inline]
```

Set the Value object.

Parameters

<i>value</i>	
--------------	--

5.11.2 Variable Documentation

5.11.2.1 prime_sizes

```
int prime_sizes[]
```

Initial value:

```
= {  
    53,          97,          193,          389,          769,          1543,          3079,  
    6151,        12289,        24593,        49157,        98317,        196613,        393241,  
    786433,      1572869,      3145739,      6291469,      12582917,      25165843,      50331653,  
    100663319,  201326611,  402653189,  805306457,  1610612741}
```

We want the capacity of the Hash Table to be a prime number, according to the theory. So the following list consists of prime numbers that are proven good capacity values for a Hash Table. When a rehash is needed, the capacity of the new table will be chosen from this table. If more than 1610612741 elements are needed, we double the capacity of the old table at rehash.

5.12 ADTPQueue.cpp File Reference

An ADT Priority Queue implemented using a heap.

```
#include "cppdescent/ADTPQueue.hpp"  
#include <iostream>  
Include dependency graph for ADTPQueue.cpp:
```

5.12.1 Detailed Description

An ADT Priority Queue implemented using a heap.
